

Evaluating the best model in Multiple Linear Regression:

For the dataset discussed in the lecture,

- Detect if there are any outliers in the dataset that are impacting the model performance. If so, handle the outliers as discussed in the lecture. Find out if there is any difference in the model performance.
- Perform a data split of 60/40 and 90/10 and compare the metrics. Conclude which model is performing better.
- Build multiple linear regression models by dropping one feature at a time i.e.
 - Build a multiple linear regression model with TV, Radio and Sales.
 - Build a multiple linear regression model with TV, Newspaper and Sales.
 - Build a multiple linear regression model with Radio, Newspaper and Sales.
 - Conclude which combination of features is performing better.

Submission:

Please provide clear observations and conclusions on model performance and factors for a better performing model. Submit a .ipynb notebook to the classrooms.
